

Top 100 Cited Articles in Thyroid Cancer: A Bibliometric Analysis

Tiroid Kanserinde En Fazla Atif Alan 100 Makale: Bibliyometrik Bir Analiz

 Veysel Barış TURHAN,  Abdulkadir ÜNSAL

Department of General Surgery, University of Health Sciences Keçiören Training and Research Hospital, Ankara TURKEY

Abstract

Objective: To identify and analyze the 100 most cited articles on thyroid cancer since 1975, thus, allowing their easy access for researchers in this field. **Material and Methods:** This study is a bibliometric analysis of research publications acquired from the Web of Science database. We evaluated the first 100 articles receiving the most citations in the field of thyroid cancer since 1975. Then, all research publications were compiled using journal information into different categories based on the study type, country, research centers, authors, and publication dates. All data were reported as percentages, numbers, and graphs. **Results:** In this study, we listed 8,608 full-length English-language articles. Our findings showed that the most cited article received 4,325 citations to date, while the Journal of Clinical Endocrinology Metabolism, a Thyroid journal, received the most number of citations ($n=6531$), publishing seventeen of the articles from our study. Also, thirty-two articles were from the field of oncology. The country with the most number of publications was the United States of America ($n=70$) in the years 2005, 2008, and 2009 ($n=8$). **Conclusion:** It is essential to acknowledge the top-cited articles in thyroid cancer since they contain essential information, research, and advances in its treatment. Our analysis of the first 100 articles included the most important papers with the most significant impact on thyroid cancer research. In our list, we acknowledged the most productive authors and institutions along with their research articles.

Keywords: Bibliometric study; citation; thyroid cancer

Özet

Amaç: Bu makaledeki amacımız, 1975 yılından bu yana tiroid kanseri ile ilgili en çok atif alan 100 makaleyi belirlemek ve analiz etmek, böylece bu alandaki araştırmacılar kolay erişim sağlamaktır. **Gereç ve Yöntemler:** Bu çalışma, Web of Science veri tabanından elde edilen araştırma yayınılarının bibliyometrik analizidir. 1975 yılından bu yana tiroid kanseri alanında en çok atif alan ilk 100 makaleyi değerlendirdik. Ardından tüm makaleler, dergi bilgileri kullanılarak, çalışma türü, çalışmanın yapıldığı ülke, çalışmanın yapıldığı araştırma merkezi, makalenin yazarları ve yayın tarihlerine göre farklı kategorilerde değerlendirildi. Tüm veriler yüzde, sayı ve grafik olarak rapor edildi. **Bulgular:** Bu çalışmada, 8.608 tam uzunlukta İngilizce makale listelendi. Bulgularımız, bugüne kadar en çok atif alan makalenin 4.325 atif aldığı, bir tiroid dergisi olan Journal of Clinical Endocrinology Metabolism'in ise en fazla atif aldığı ($n=6531$) ve konumuzla ilgili 17 makale yayınladığını gösterdi. Ayrıca onkoloji alanından 32 makale vardı. 2005, 2008 ve 2009 yıllarında ($n=8$) en fazla yayına sahip ülke Amerika Birleşik Devletleri ($n=70$) olmuştur. **Sonuç:** Tiroid kanserinde en çok atif alan makaleleri, temel bilgileri, araştırmaları ve tedavisindeki ilerlemeleri içerdigi için bilmek önemlidir. İlk 100 makaleye ilişkin analizimiz, tiroid kanseri araştırmaları üzerinde en önemli etkiye sahip en önemli makaleleri içeriyyordu. Listemizde en verimli yazarları ve kurumları araştırma makaleleriyle birlikte sectik.

Anahtar kelimeler: Bibliyometrik çalışma; alıntı; tiroid kanseri

Introduction

An increasing incidence of thyroid cancer has been observed in the last 50 years. From 1990 to 2013, the global age-standardized incidence rate of thyroid cancer has increased by 20%, with a more significant increase in low-income countries (33%) compared to high-income countries (19%) (1). A large body of research has been published in journals within oncology, surgery, medical, basic sciences, and radiology fields. Although important studies and clinical trials have been conducted on thyroid cancer, most clinicians are not aware of the existence of these studies. However, these publications can significantly improve future treatments for thyroid cancer patients since the decision of clinicians is based on evidence and scientific research of a high impact. Hence, it is required to identify the 100 most cited articles (2). Several bibliometric studies in the past have identified the most cited articles in various fields, such as colon cancer (3), breast cancer (4), general surgery (5), and bariatric surgery (6), which has allowed the medical researchers and personnel in this field to easily access such studies. However, to date, no such research has been conducted to determine the most influential papers in the areas of thyroid cancer research and treatment.

This study aimed to identify and analyze the qualities of the top 100 most cited papers in thyroid cancer or related research. Here, we observed how the knowledge related to thyroid cancer has evolved and changed the management of the disease over time. This study served as a reliable reference for the most cited articles on thyroid cancer.

Material and Methods

We obtained the data from the WoS Core Collection database (Clarivate Analytics, USA) of Thomson Reuters. The data were accessed in the WoS database between 1975 and 2021 using the keyword "thyroid cancer" (access date: 04.01.2021). Articles not related to thyroid cancer were excluded from our study, and only the original research articles written in English were included. Our search initially produced 14,467 published articles. Out of which, the first 100 articles with the most citations were evaluated. Due to the differences in publica-

tion time between the first 100 articles, the older articles were more likely to receive more citations due to the availability of longer citation time. Due to this bias, we calculated the average number of citations per year (ACY) for each article. Finally, we collected the following information from the top 100 cited articles: the article title, the journals where they were published, the study categories, the country the research was conducted in, the centers where the study was conducted, the authors, and the publication dates. For each research journal, the five-year impact factor (2020) responsible for publishing the articles was also recorded.

Ethical Statement

Since this study is a bibliometric assessment designed as citation analysis, it did not require approval from the ethics committee. The study was performed according to the Helsinki declaration.

Statistical Analysis

Since our study was a bibliometric analysis, no statistical analysis methods were used. All data obtained are presented in the form of tables and bar charts.

Results

In this study, we listed 8,608 full-length articles in English. The 100 most cited articles in our list were published between 1987 and 2017 and are shown in Table 1. The number of citations ranged from 197 to 4,325, with the average number of citations being 427.14 ± 498.55 , while the average number of ACY was 45.75 ± 109.35 . The most cited article on thyroid cancer was written by Haugen et al. (7) with an ACY of 1081.25, which was published in the Thyroid journal in 2016, while the least cited article was published by Kim et al. in 2012 (8) with 197 citations and an ACY of 24.63.

The number of most cited articles peaked in 2005, 2008, and 2009 which included eight publications (Figure 1). In the listed 100 articles, a total number of 42,714 citations were made collectively. The most citations were from the articles published in 2019, with the total citation number being 4,046. These first 100 articles were published in 38 different journals (Table 2).

The Journal of Clinical Endocrinology Metabolism published most of the articles in the top 100 list (17 articles) and had the most citations (4,740 citations) as well. The European Journal of Nuclear Medicine, now known as the European Journal of Nuclear Medicine And Molecular Imaging, published one manuscript, which ranked 88th in the top 100.

The country with the highest number of publications among the top 100 cited articles was the United States of America, with 70 papers. The result of this bibliographic analysis identified the Memorial Sloan Kettering Cancer Care Center as the top institute having the most articles in the top 100, which included a total number of 17 articles and 9,347 citations (Table 3).

Of the top 100, most cited articles were published by Fagin JA. and Schlumberger M., who were the most cited co-authors with a rate of 10%, followed by Elisei R. and Sherman SI. (Table 4). Also, 32% of these articles were categorized under the title of oncology, followed by the fields of endocrinology metabolism, internal general medicine, and surgery.

Discussion

One of the earlier studies reported that nearly half of all scientific publications received no citations, where the number of articles having more than 100 citations was less than 2% (5). Even the most scientifically interesting articles needed time to obtain citations from subsequent publications. The bibliometric analysis can help researchers easily access and analyze a variety of topics providing a historical perspective on medical-related scientific progress.

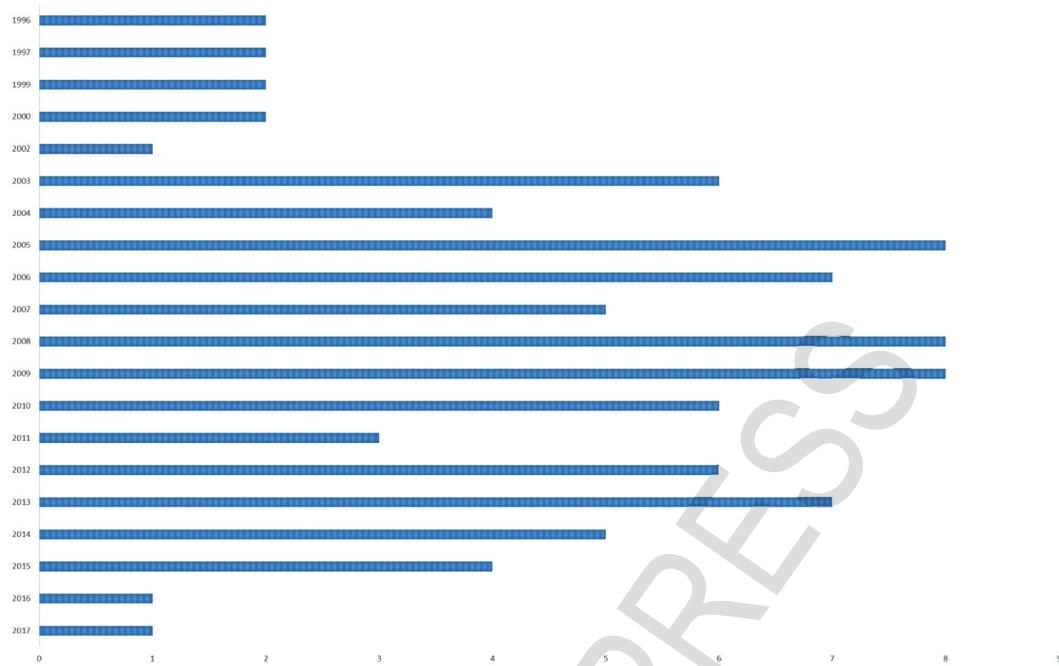

Figure 1. The number of peaks for the most cited articles.

A bibliometric study includes information about the trends in research over time. The number of times other research articles cite a publication is often used to measure the impact of the journal along with validating authors' contributions (9,10). This study aimed to identify the first 100 most cited articles on thyroid cancer, making it easier for researchers to locate and read these papers. Although bibliometric studies have been conducted on many other subjects before, ours is the first of its kind study for thyroid cancer (4-6,9,10).

The time of publishing can significantly impact an article's citation ranking. Logically, the citations of an article depend on publication time because citations tend to accumulate over time. Although the number of citations shows an increase as time passes, some valuable articles may receive a high number of citations in the year they are published. An example of this is the article published in 2016, which ranked first in our study with 4,325 citations (7). As time goes by, articles published a long time ago may get fewer citations as their findings become assimilated and do not need further references. Additionally, the absence of articles before 1982 in our list of the most cited articles may indicate the futility of outdated

articles in modern times. Although it is difficult to examine the top 100 articles with the most citations, we found the publication duration for the first 100 articles to be between 1982 and 2017. Most articles within the top 100 list were between 2008 and 2009, with another peak observed in 2013. The reason for this may be the involvement of phase III studies of specific agents in advanced stage cancers, which were published in the above-mentioned years. In the bibliometric analysis study on colon cancer (3), 2004 was found to be the peak year for the number of publications, while the highest publication years for breast cancer were 2001 and 2010 (4).

Of the top 100 articles, 70 were from the United States of America (USA). Moreover, the publications from the USA preferred to cite other articles also from the USA (11,12). The country's publications were also high in other clinical disciplines, such as cardiology (13), intensive care (14), respiratory (15), and urology (16). These findings show that the USA is at the forefront of thyroid cancer studies. A wide range of patient populations with significant financial support to the researchers could be the main reason behind this.

*2019 Journal Citation Reports (Clarivate Analytics).

The authors for the most cited article were Haugen et al. (7), and their publication was reviewed by the guidelines for the American Thyroid Association (ATA). It is not surprising that this article, examined by the ATA

guideline, was the most frequently used article by the surgeons interested in thyroid surgery. This study has developed evidence-based recommendations to make clinically-informed decisions in managing thyroid

nodules and differentiated thyroid cancer. Further, seven different guideline studies were also present in the top 100. The second most cited article investigated the incidence, histology, size distribution, and mortality caused by thyroid cancer (17), along with highlighting the advances in the diagnosis of subclinical disease. The third

most cited article was by Mazzaferri et al., published in 1994, which has considerably progressed thyroid cancer treatment in the years to follow (18).

The connection between the thyroid gland and genetics is one of the topics discussed in many studies, and over 22 manuscripts in the top 100 list included research on genetic mutations. Our result is not surprising since there is a well-established link between genetics and thyroid cancer. Research articles, including four drugs for advanced and iodine-131 resistant thyroid cancers, were shown to act as promising treatments between 2012 and 2015.

Of the top 100 cited studies, 17 were drug trials with three papers on Vandetanib. The first study was published in 2010 (19) and had concluded that vandetanib might be an effective therapeutic option in patients with locally advanced or hereditary medullary thyroid cancer (MTC). Vandetanib, the first targeted drug, showed efficacy in a randomized phase II trial in the year 2012, along with efficacy in a phase III study of patients with advanced MTC (20,21). Lenvatinib was associated with significant improvements in progression-free survival and response rates in patients with iodine-131-resistant thyroid cancer compared to placebo (22). Similarly, Sorafenib significantly improved progression-free survival in patients with progressive and radioactive iodine-refractory differentiated thyroid cancer compared to placebo (23). A phase II study of Sorafenib was published in 2008 and was identified among our list of the first 100 articles (24). Apart from that, two other papers also discussed the efficacy of sorafenib in thyroid cancer (25,26). Cabozantinib showed a statistically significant improvement of progression-free survival in patients with progressive metastatic MTC (27,28). In the same year, a phase II study on axitinib was published due to its effectiveness in treating all thyroid cancer stages (29). Also, we observed that the Selumetinib article published in 2013 was in the top 100 list (30), and a significant breakthrough for advanced-stage thyroid cancer treatment was made in the same year.

Of the top 100 articles, 12 articles are on MTC, indicating the importance of this cancer type. A 2003 article discussed the lymph

node dissection patterns of hereditary and sporadic medullary cancer along with the early malignant progression of hereditary MTC (31). Further, an article on the importance of using calcitonin in the follow-up in MTC patients was published in 2004 (32). Later, the prognostic significance of somatic RET oncogene mutations in sporadic MTC was investigated as well (33). Among the top 100 articles, the studies of Elisei et al. were mainly about MTC, while three of the 12 MTC-related articles belonged to another research group (27,32,33).

Investigating the incidence of the disease has always been a popular topic. In our study, 12 papers included incidence studies. We also encountered three studies investigating the effects of external radiation on thyroid cancer. Among the top 100 cited studies, ten papers were based on I-131 treatment. A study on robotic surgery, a popular topic of recent times, was also included in the top 100 list (34), and we believe that this may increase in the future.

The most cited co-authors standing out in their fields were Fagin JA and Schlumberger M, who wrote 20 articles in the top 100 list. The most interesting finding of our study was that not all articles published in journals with high impact factors received high citation scores. However, previous studies had concluded that high citation articles were found in journals with high impact factors (4). Our study showed that even journals with a 5-year impact factor of 0.692 could enter the top 100 list with just one article, and although the New England Journal of Medicine had the highest impact factor, it was not the most-cited. Also, the Thyroid journal, even at the top of the list with eight articles, had more than half of the citations taken only from a single article (7).

In this bibliometric analysis, the vast majority of the top 100 articles were from the field of oncology, followed by endocrine sciences and the general internal medicine research, while pharmacology was at the bottom of the list. General surgeons also contributed significantly to the field of thyroid cancer. However, there are some limitations to our research. Firstly, deliberate omissions of many citations were done for reasons such as disproportionate or inappropriate citations, institutional and language bias, self-

attribution, and strong personal bias. Secondly, there were differences in the broadcast times since older articles had the opportunity to get more citations. For this reason, valuable studies published recently may show up with high citations in similar bibliometric studies conducted in the future. Also, many writers in the top 100 may have contributed to multiple articles, although they were not the first or senior authors. To our knowledge, this article is the first bibliometric study in the field of thyroid cancer. In this study, we identified that the most cited article provided a guideline analysis while the most popular subjects were genetics and medullary cancer. We believe that this study can shed light on the authors working in this field and provide easy access to all medical researchers and staff, thus, contributing to the thyroid cancer field.

Acknowledgment

Thanks to AME Editor from American Manuscript Editors for editing the manuscript.

Source of Finance

During this study, no financial or spiritual support was received neither from any pharmaceutical company that has a direct connection with the research subject, nor from a company that provides or produces medical instruments and materials which may negatively affect the evaluation process of this study.

Conflict of Interest

No conflicts of interest between the authors and / or family members of the scientific and medical committee members or members of the potential conflicts of interest, counseling, expertise, working conditions, share holding and similar situations in any firm.
